

Manual ratchet hoist: LB

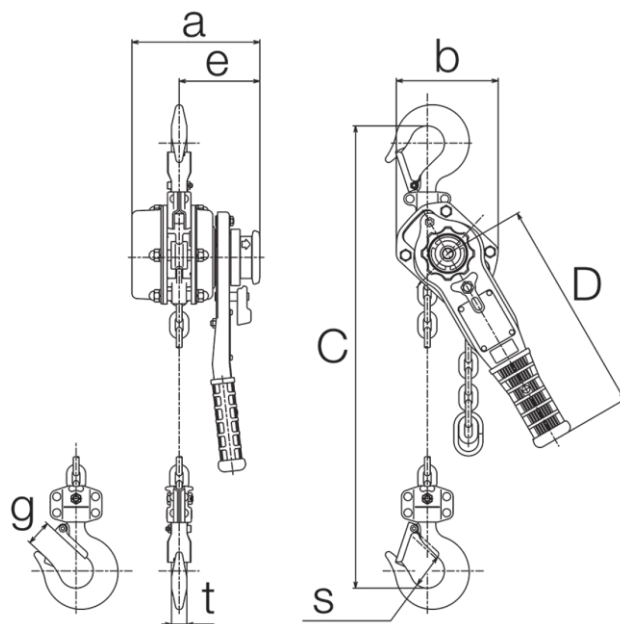

The forged LB5, an all-new, industry-leading benchmark for being smaller, lighter and stronger than any other lever hoist on the market. Its proven strength and durability withstand a multitude of strenuous applications, including environments where temperatures drop as low as -40° C.

An advanced high-frequency heat treatment process ensures uniform hardness across all major load-bearing parts. The process creates a truly robust hoist that you can safely take into any environment.

Our widely acclaimed fail-safe freewheel system closes the gap between operator safety and load control. Developed in-house 30 years ago, the freewheel mechanism was intentionally created as a two-step process to eliminate the risk of accidental free threading. The result is dramatically improved functionality and operator safety.

Taking a hoist out of service due to a broken or damaged hook lock is unacceptable. That's why the LB lock is specifically designed to protect it from damage. The notch on the end of the latch is designed to engage the end of the hook to protect against side impact damage. The latch is also constructed of reinforced steel and secured by an enlarged anchor at the base to increase its rigidity.
